# Sea ice: physical properties, processes and trends

**Stephen Howell**  
**Climate Research Division,**  
**Environment and Climate Change Canada**  
**July 18, 2017**

# 3-Part Sea Ice Lecture Overview

- 1. Physical properties, processes and trends
- 2. Observations
- 3. Canadian Arctic

# Outline

---

- Introduction
- Ice types
- Seasonal cycle
- Sea ice dynamics
- Snow on sea ice
- Recent trends

Page 3 – July 18, 2017

# Introduction: global distribution

- Sea ice is any form of ice that is found at sea and has originated from the freezing of sea water
- On average, sea ice covers about 25 million km<sup>2</sup> of the Earth, or about two-and-a-half times the area of Canada

- Arctic
  - Min: 7 million km<sup>2</sup>\*
  - Max: 15 million km<sup>2</sup>
- Antarctica
  - Min: ~3 million km<sup>2</sup>
  - Max: 18 million km<sup>2</sup>

# Introduction: importance

- 1. Has a high albedo and this keeps the planet cool.
- 2. Fills a central role in the lives and customs of Inuit.
- 3. Provides a place for polar bears, seals, and other animals to live.
- 4. Influences ocean circulation.
- **Does not raise sea level when it melts, because it forms from ocean water.**

# Sea Ice Types

# Sea ice types

---

- **New Ice:** Recently formed ice composed of ice crystals that are only weakly frozen together (if at all) and have a definite form only while they are afloat.
- **Nilas:** A thin elastic crust of ice (up to 10 cm in thickness), easily bending on waves and swell and under pressure growing in a pattern of interlocking "fingers" (finger rafting).

- **Young Ice:** Ice in the transition stage between nilas and first-year ice, 10-30 cm in thickness.

# Sea ice types

- ***First-Year Ice***: Sea ice of not more than one winter's growth, developing from young ice, with a thickness of 30 cm to ~2 m.

# Sea ice types

- ***Multi-year/old ice***: Sea ice that has survived at least one summer's melt. Hummocky topography from freeze-thaw.

Page 9 – July 18, 2017

# Sea ice concentration

- Given in tenths
  - e.g. 10/10 is 100% covered
- Extent = concentration<sub>1.5/10</sub> x area
- Coverage = concentration x area

<1/10

Open water/  
Eau libre

1-3/10

Very open drift/  
Banquise très lâche

4-6/10

Open drift/  
Banquise lâche

7-8/10

Close pack/Drift  
Banquise serrée

9/10

Very close pack/  
Banquise très serrée

9+10

Very close pack/  
Banquise très serrée

10/10

Compact/Consolidated ice  
Banquise compact/consolidée

# Seasonal Cycle

# The seasonal cycle of Arctic sea ice: extent

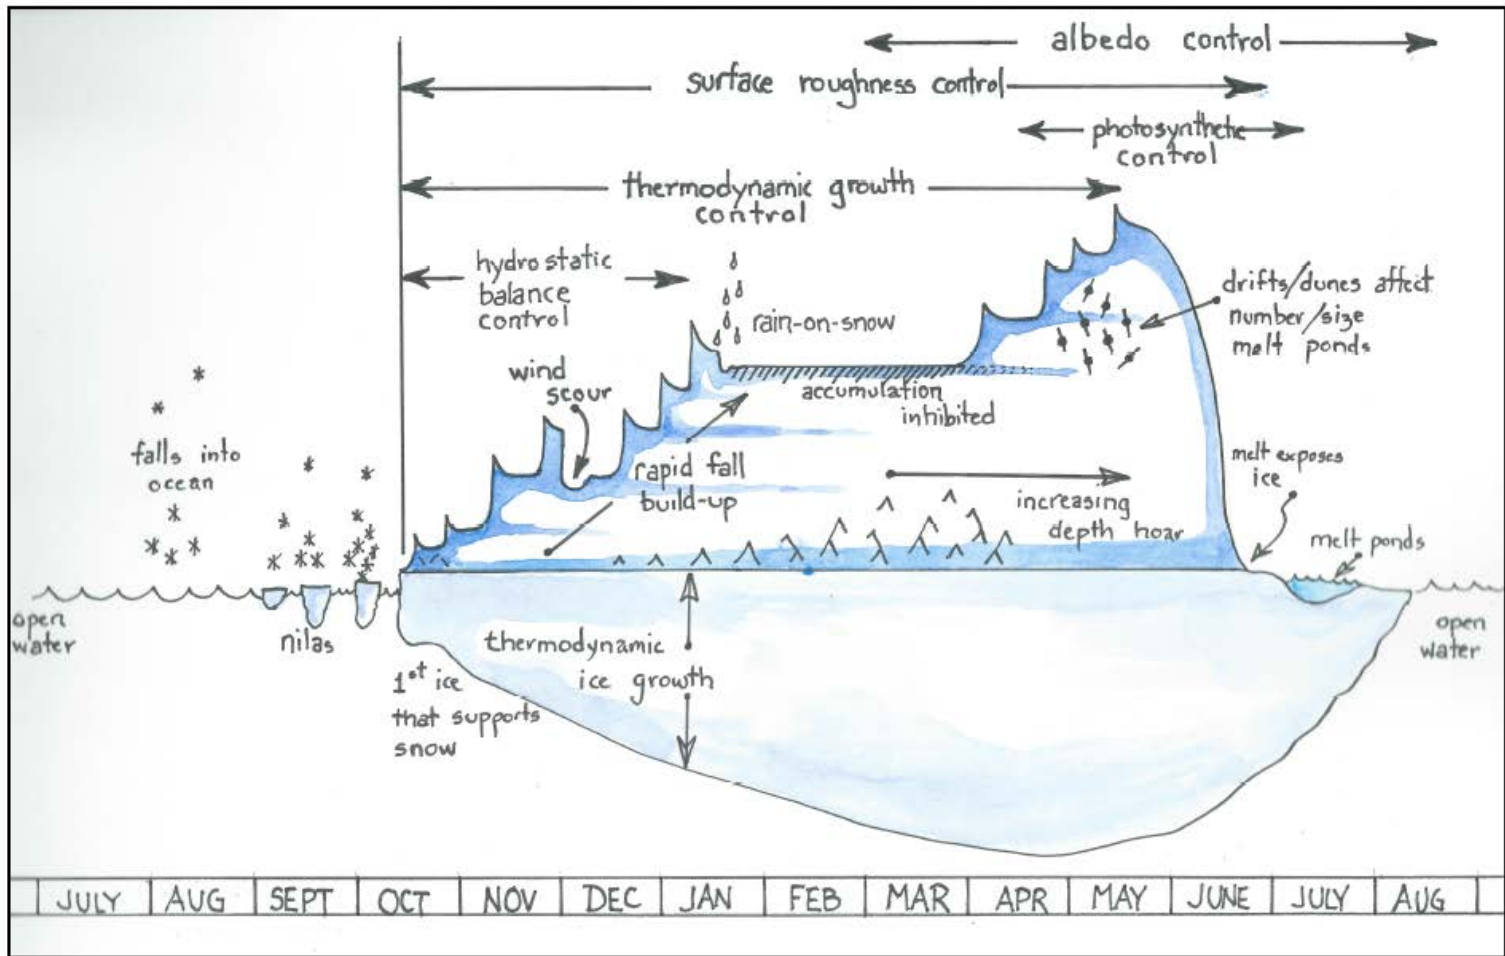

University of Bremen/NASA

Canada

# The seasonal cycle of sea ice thickness

# The seasonal cycle of sea ice: snow

# The seasonal cycle of sea ice: snow

- Snow cover acts as a blanket, slowing down the flow of heat from the water.
  - Snow cover plays an important role during ice growth. This is because its large air content makes it a poor conductor of heat (but a good insulator) with a thermal conductivity between  $0.1$  and  $0.4 \text{ Wm}^{-1} \text{ K}^{-1}$  compared to  $2 \text{ Wm}^{-1} \text{ K}^{-1}$  for sea ice.

<b>5 cm of various snow types:</b>	<b>Equivalent to an ice thickness of:</b>
Newly fallen soft snow	264 - 381 cm
Slightly settled snow	175 - 193 cm
Normal Snow	61 - 97 cm
Old Snow	41 - 61 cm
Hard packed snow	24 - 31 cm
Extremely cold, wind swept snow	19-24

# The seasonal cycle of sea ice: snow

Howell et al., 2016

# The seasonal cycle of sea ice: albedo

# The seasonal cycle of sea ice: albedo feedback

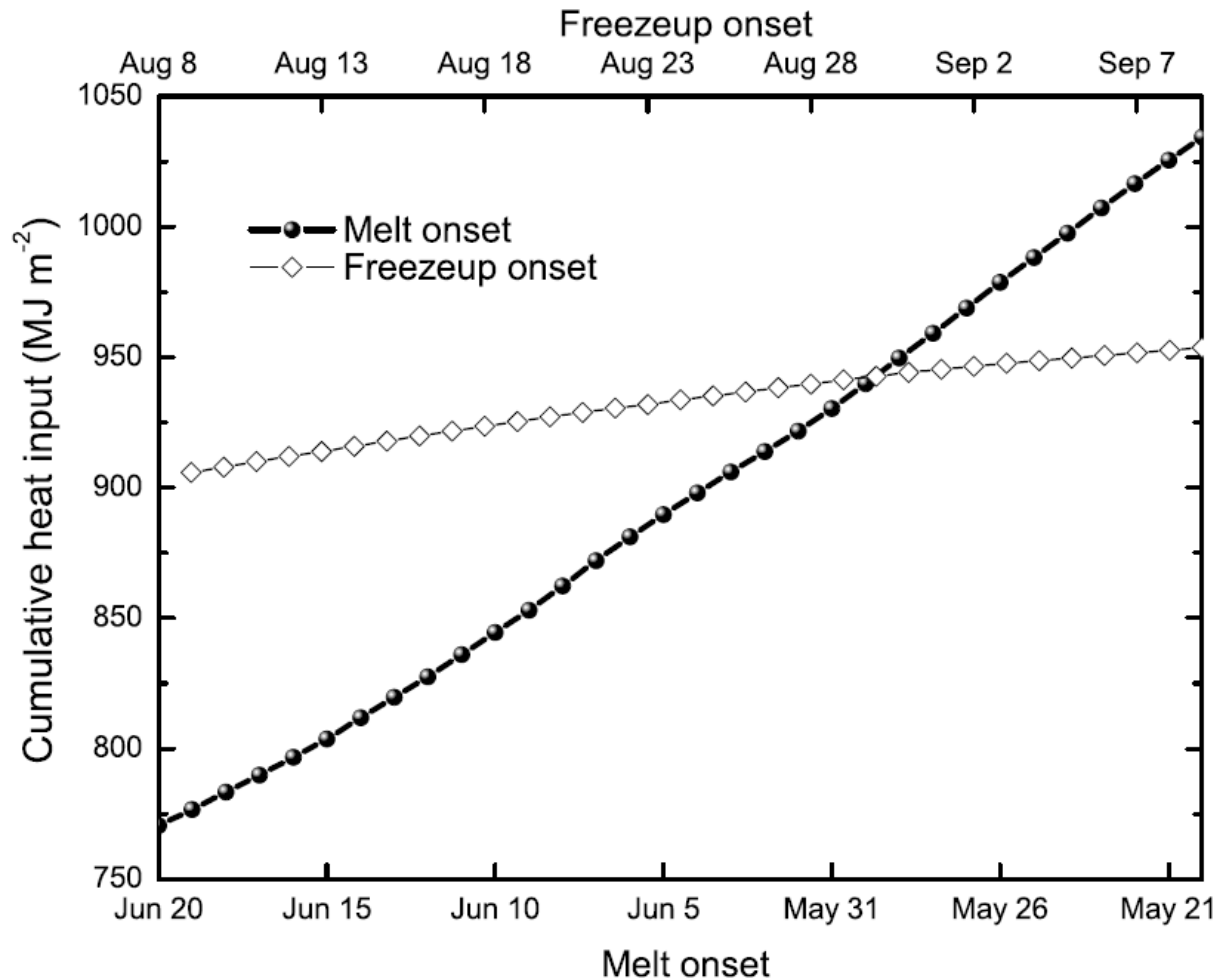

- The transition to melt conditions is directly related to the albedo of the surface warming of the snowpack.

Page 21 – July 18, 2017

# The seasonal cycle of sea ice: timing of melt and freeze onset

Environment and  
Climate Change Canada

Environnement et

# Sea Ice Dynamics

# Sea Ice Dynamics

- The exchange of momentum due to turbulent process controls sea ice motion.
  - most important related processes are divergence and convergence.

C. Haas

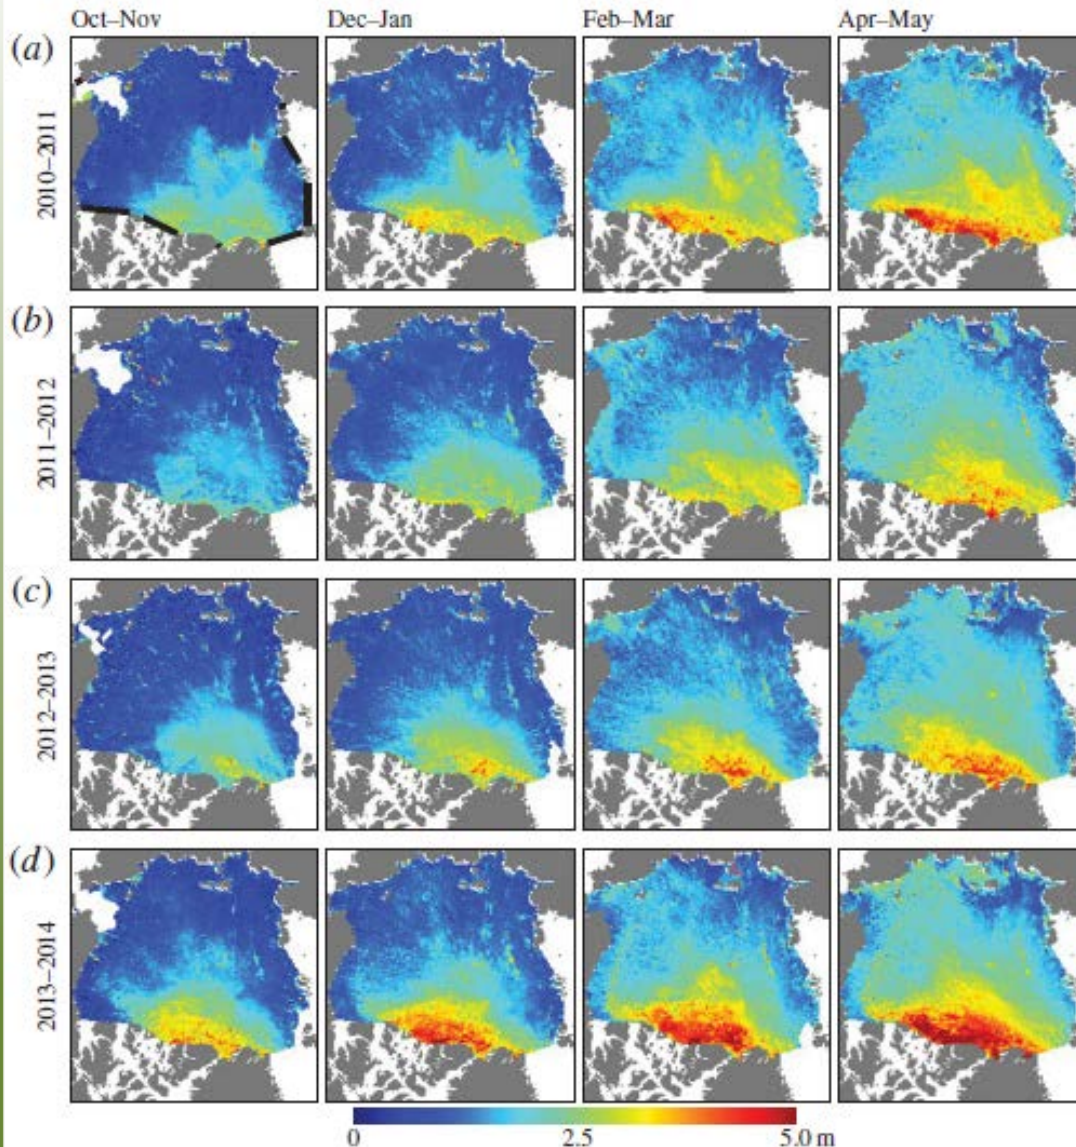

# Sea ice dynamics: divergence

- Leads result from local ice divergence creating long narrow channels also induced by tides.
- Flaw leads form along the edge of landfast ice and the polar pack.

# Sea ice dynamics: convergence

- Mean thickness of a region is more dependent on the number (and thickness) of ridges than the thickness of level ice
- The overall volume within an ice region, dynamics are more important than thermodynamics

Kwok and Cunningham, 2015

# Trends

# Arctic sea ice trends: extent

- September Arctic sea ice is declining at a rate of 13.3% per decade over the 1979-2016 period.
- The ten lowest September ice extents over the satellite record have all occurred in the ten years.

Page 29 – July 18, 2017

Climate Change Canada

Environnement et  
Changement climatique Canada

Canada

# Arctic sea ice trends: melt/freeze

- All Arctic: melt onset earlier by 2 days per decade, freeze onset delayed by 3 days per decade and melt season length is increasing at 5 days per decade.

Page 34 – July 18, 2017
